

Mobile Device Management – Apple Products Solution

Mobile Device Management (MDM) is an increasingly popular choice for progressive, security-oriented companies who wish to administrate their employees' devices. Onca Technologies can implement MDM functionality for all iOS and OS X Apple devices, allowing corporate data to be managed easily and safely.

New devices can be enrolled and deployed out of the box without Onca Technologies ever touching the device, and existing devices can be enrolled in just a few seconds. Using a combination of the Device Enrolment Program (DEP) and Volume Purchasing Program (VPP), our MDM can provide extensive yet simple deployment of devices and apps without comprising the personal use of employees.

Key Benefits

- Secure and manage company-related information
- Remotely lock, unlock or wipe any enrolled device
- Fully automated deployment of new devices with zero touch configuration
 - Quick and easy enrollment so all existing devices can be used
 - Push or pull company-owned apps to any device
 - Automatically push software updates
- Employee-owned devices can be configured for BYOD environments
 - User accounts can be linked to multiple devices

Apps can be purchased in volume for the company and pushed automatically to each user's device. These apps remain the property of the company and so can be pulled back from the device and assigned to a different user as and when required. With DEP, large-scale deployments of iPads, iPhones, and Macs is seamless. MDM enrolment is automated for every device, and they are immediately configured with account settings, apps, and access to corporate services upon activation. The need for staging services or IT to physically access each device to complete setup is eliminated.
